I²OS AGENTIC PLATFORM · HEALTHCARE

Home Health Nurse AI

An in-home visit copilot that listens to the visit, transcribes live, and auto-fills OASIS documentation as the nurse works — review and submit in one pass.

Ambient capture

Live OASIS-E auto-fill

Review & submit

Use Case Summary

Documentation is eating the home visit

Home health nurses spend hours after every visit translating what happened into the OASIS assessment — a 100+ element instrument that drives care planning, PDGM reimbursement, and audit exposure.

Charting bleeds into evenings and weekends, accuracy slips under time pressure, and the patient gets a clinician staring at a laptop instead of at them.

Home Health Nurse AI sits in the visit as an ambient copilot: it listens, transcribes, and builds the OASIS record in real time so the nurse reviews and submits before leaving the driveway.

~1 in 4 hrs

of a home health nurse's day goes to documentation, much of it after hours

100+ items

per OASIS-E assessment — manually keyed from memory and notes

Audit risk

inaccurate or inconsistent coding threatens reimbursement and compliance

Figures are illustrative of well-documented home-health documentation burden.

One pass, from doorway to submitted record

Ambient capture replaces after-hours charting — the record is done when the visit is done.

Agentic architecture on the I²OS platform

Capture Layer

- Ambient audio capture on phone or tablet
- Edge buffering for low-connectivity homes
- Consent & session controls

Intelligence Layer

- Clinical ASR with speaker diarization
- OASIS-E mapping & coding agent
- Confidence scoring + gap detection

Integration Layer

- Review & submit workflow
- EHR write-back (WellSky, HCHB, etc.)
- Audit trail & compliance logging

Visit audio → Transcript → Mapped OASIS-E draft → Nurse review → Submitted to EHR

CAPABILITIES

What the copilot does in the field

Ambient visit capture

Hands-free listening during the assessment — no forms, no typing mid-visit.

Clinical live transcription

Speaker-separated transcript tuned to medical and home-health vocabulary.

OASIS-E auto-population

Maps findings to M-items and GG functional items with linked source quotes.

Coding & gap assistance

Flags missing data, inconsistencies, and likely coding for accuracy and PDGM.

Offline-capable

Captures and processes in low- or no-connectivity homes, syncs when back online.

EHR integration

Write-back to WellSky, Homecare Homebase and other home-health systems.

Voice intake in action

MEDHELP voice intake — live extraction into a structured, EHR-ready patient profile.

Capture & transcribe

Ambient recording or uploaded audio, transcribed live as the visit happens.

Fields populate in real time with a completeness tracker — here, 9 of 13 captured.

Flags what's missing — allergies, vitals — and prompts the nurse to confirm.

BENEFITS

Time back, accuracy up, patients first

Up to 70%

less time spent on OASIS documentation per visit

Near-zero

after-hours “pajama time” charting

Cleaner

coding for stronger PDGM accuracy & audit defense

For nurses

- Hours of charting reclaimed
- Less burnout, lower turnover
- Eyes on the patient, not the laptop

For patients

- More present, human visits
- Accurate care plans from day one
- Faster start of care

For the agency

- Faster visit-to-bill cycle
- Defensible, consistent OASIS coding
- Higher clinician capacity

Benefit ranges are directional targets, validated per deployment.

THE OUTCOME

The record is done when the visit is done.

Home Health Nurse AI turns the OASIS burden into a review step — giving clinicians their evenings back, sharpening coding accuracy, and putting the focus back on the patient in front of them.
